

# Intro to R for Biologists

**IBiS Special Topics, Fall 2021**

**Class 16: Nov. 15, 2021**

**Erik Andersen and Shelby Blythe**

# RNA-seq analysis

# Two general flavors of alignment methods

# Read aligners that use reference genomes and gene models

## **bowtie2**

Ultrafast, memory-efficient tool for reads up to thousands of bases, indexes the reference genome  
Langmead lab at Johns Hopkins University

## **HISAT2**

Fast and sensitive graph-based aligner, creates graphs of the reference genome  
Langmead and Salzberg labs at Johns Hopkins University

## **STAR**

Ultrafast and sensitive aligner that uses models of spliced transcripts in the reference transcriptome  
Dobin lab at Cornell University

# Read aligners that don't use reference genomes

## **kallisto**

Ultrafast, memory-efficient tool that quantifies transcript abundances using pseudo alignment of reads to a graph transcriptome  
Pachter lab at CalTech

## **salmon**

Fast tool to build an indexed transcriptome and quantify reads  
Patro lab at Stony Brook University

# Which analysis workflow is “better”?

Ease of installation, maintained (check GitHub), used by others

Most perform well

Simulate and decide for yourself

Use known data and decide for yourself (always reverse lists)

Ease of “gut checks” (sleuth has beautiful shiny app)

## transcript view

Boxplots of transcript abundances showing technical variation in each sample.
